

PLUS: Things That are Positive	MINUS: Things That Might be a Challenge	INTERESTING: Things I'd Like to Know More About
Technology has further developed the healthcare system through anesthetics and antibiotics to magnetic resonance and radiotherapy	Surgeons might be replaced by robots with more steady hands more capable for surgery operations than a regular doctor. All this would be a positive except for the fact that people all over the world would lose their jobs and the ten years of their lives they spent studying the medical field to have the credibility you need to become a surgeon.	I think it'd be interesting to read more about the development of technologies within the hospital where we look at a timeline of when the technology was introduced and how it affected the medical industry for better or for worse

Summary: Technology increases the development of healthcare more rapidly, it drives innovation and instead of making up some predictions, this article from the government explores how the future of healthcare will likely look like. With the use of technology there is no racial bias and stigma, furthermore patients will receive proper care with no human errors and ignorance. Nurses' jobs will only get easier as we already have technologies to assist them. Some new ideas that could be implemented in the near future are: "Infusion pumps, dialysis machines, antibiotics, heart valves, MRI scanners, even hand washing stations." We have tools like the implanted defibrillators to keep doctors up to date with everything going on with their patients around the clock.

The technology that is being mentioned in this article are all things that have helped mankind and made health care much better. The technology the article is talking about further developing health care and assisting people working in the medical field execute their jobs perfectly. The use of technology has helped us examine ourselves from the inside out using x-rays and done nothing but help sick patients become better since being introduced into the public. X-rays along with many other technologies have been nothing but good and useful to the people who need its uses.
